BILATERAL MEETINGS

Friday 10th November 11:00 - 13:00

Friday 10th November 13:30 - 15:30

DESCRIPTION Our company, CIVKON AGI as a part of the construction sector, from the very beginning has started to work on improving energy efficiency in our country. Working on many projects, we have seen the need for real time measuring of energy efficiency and checking the quality of buildings and their installations. Therefore, as a part of our company, we developed the BUILDING DOCTORS sector, offering the service "Home Inspection" or "Building Diagnostics" using sophisticated measuring and diagnostic equipment from reputable manufacturers. We have licenses and certificates, for all procedures.

All diagnostic methods are non-destructive and without any influence on objects, people or equipment.

Offering expertise

BUILDING INSPECTION

We offer the service "Home Inspection" or "Building Diagnostics" using sophisticated measuring and diagnostic equipment.

We are all facing problems with the quality of the construction provided by contractors when building a new building, or, in already constructed objects, there are very often problems like: mold, moisture, water and air leaks, cold walls, thermal bridges, poorly-constructed roofs and terraces, high expenses for heating and cooling, non-functionality of HVAC systems, etc.

CIVKON AGI CAN HELP YOU:

- To get exactly what are you paying for
- To have an insight into the quality of your building's construction
- To have proof of the quality of your facility
- To get an object with extremely low heating and cooling costs
- To prevent or eliminate problems with mold, moisture, condensation, air and water leakage
- To test the sealing of a room for the efficiency of gas anti-fire systems
- To locate the exact places of water leaks in the basement, through the roof, and through the terraces
- To locate the places of liquid or gas leaking pipes in walls or floors, from all types of installations
- To control and locate if there is any, water leaking through the glazing, structural or panel façade under strong rainfall and wind

IMPORTANT: all diagnostic methods are non-destructive and without any influence on objects, people or equipment.
